

BAB V

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Berdasarkan pemaparan dan hasil analisis yang dilakukan pada bab sebelumnya, maka dapat diambil beberapa kesimpulan, diantaranya adalah sebagai berikut:

1. Dari hasil analisis hidrologi, nilai debit yang digunakan untuk me *Running* kedalam program HEC-RAS ada dua, yaitu nilai debit dengan kala ulang dua tahun $Q_2=37,578 \text{ m}^3/\text{dt}$ dan data debit dengan kala ulang lima tahun $Q_5=53,446 \text{ m}^3/\text{dt}$.
2. Dari hasil analisis menggunakan program HEC-RAS 4.1.0 telah menunjukkan bahwa, terjadi kenaikan muka air banjir pada sungai yang melewati batas tanggul sungai. Namun sifatnya variatif yang tidak secara keseluruhan tanggul kanan atau kiri terjadi banjir karena antara tanggul kiri dan kanan memiliki ketinggian yang berbeda. Ketinggian kenaikan muka air banjir pada sungai terjadi antara ± 1.5 sampai dengan 2,5 meter dari ketinggian tanggul eksisting.
3. Solusi yang ditawarkan dalam rangka mengantisipasi agar supaya tidak terjadi banjir pada sungai tersebut adalah dengan normalisasi dan dibuatkan tanggul di pinggir kiri dan kanan sungai dengan ketinggian yang variatif tergantung keadaan pada masing-masing ruas sungai. Sehingga dengan demikian dapat dipastikan bahwa debit air dapat ditampung oleh sungai tersebut.

5.2 Saran

Selain beberapa kesimpulan di atas, beberapa saran yang dikemukakan antara lain:

1. Dalam perencanaan pemodelan sungai kedepannya perencana harus memperhatikan lebih detail kondisi sungai, baik itu longsoran dan tumpukan sedimen.
2. Dalam penelitian selanjutnya peneliti diharapkan dapat menganalisa sedimen dengan menggunakan program HEC-RAS 4.1.0.

Syarat Pemilihan Distribusi (Sri Harto)

No	Distribusi	Syarat	Keterangan
1	Normal	$C_s \sim 0$	Jika analisis ekstrim tidak ada yang memenuhi syarat tersebut, maka digunakan Distribusi Log Pearson Type III
2	Log Normal	$C_s/C_v \sim 3$	
3	Gumbel Type I	$C_s \sim 1,1396$ $C_k \sim 5,4002$	

Karena tidak ada yang memenuhi Distribusi, maka digunakan Distribusi frekuensi Log Pearson type III

Derajat kebebasan

$p = 2$ banyak parameter untuk chi kuadrat

$$dk = k - 1$$

$$= 4 - 2 - 1$$

$$= 1$$

Derajat signifikan (α) dipilih :

$$\alpha = 5\%$$

Dari Tabel 2.7. Derajat Kebebasan Chi-Square diperoleh :

$$X^2_{cr} = 3.841$$

Syarat :

- Jika $X^2 < X^2_{cr}$, maka distribusi yang digunakan "**dapat diterima**"

- Jika $X^2 > X^2_{cr}$, maka distribusi yang digunakan "**tidak dapat diterima**"

Karena $0.995 < 3.841$, maka dapat disimpulkan distribusi yang digunakan **dapat diterima**

$$i = R_{24}/t * (t/T)^{2/3}$$

dimana :

- i = intensitas hujan rata-rata dalam mm/jar
- R_{24} = tinggi hujan maksimum dalam satu hari
- t = Waktu mulai hujan
- T = Waktu konsentrasi hujan

untuk daerah di Indonesia rata-rata t = 6 jam, maka :
